CT CHEST WITH CONTRAST - RADIOLOGY REPORT

PATIENT DATA

Name: HARRISON, Robert James

Patient ID: 418-227-093

Age: 62 years

Sex: Male

MRN: 512093

Location: Outpatient

EXAMINATION

CT of the chest with intravenous contrast. Date of exam: 09/15/2026.

Referring physician: Dr. Andrew Smith

CLINICAL INDICATION

Persistent cough of three months' duration. Former smoker  
(30 pack-years).

TECHNIQUE

Helical acquisition of the chest after intravenous contrast  
administration. No prior studies are available for comparison.

FINDINGS

Lungs: A 14 mm spiculated solid nodule is present in the apical segment  
of the right upper lobe. No additional nodules. No consolidation. No  
pleural effusion or pneumothorax.

Mediastinum: Mildly enlarged right paratracheal lymph node, measuring  
11 mm in short axis. No pericardial effusion. Heart size is normal.

Bones and soft tissues: No suspicious lytic or blastic lesions.

IMPRESSION

1. 14 mm spiculated nodule in the right upper lobe, suspicious for  
primary lung malignancy. PET-CT and tissue sampling are recommended.
2. Mildly enlarged right paratracheal lymph node, indeterminate.

Report date: 09/15/2026, 18:40

Radiologist: Dr. Laura Jones, MD

Board-certified in Radiology, License No. 245.118
